ALMOTION

NSK Linear Guide[™] High-Accuracy Series: HA/HS Models

Suitable for equipment ranging from machine tools to high-precision instruments—high-performance linear guides with premier motion accuracy

ALMOTION

High motion accuracy, high rigidity, high load capacity realized NSK Linear Guide "High-Accuracy Series HA Model and HS Model"

Trends toward higher performance and enhanced quality of electronics equipment and precision instruments have been accelerating. At the same time, demand has been growing for highly precise production systems that manufacture such equipment and instruments. High-Accuracy Series achieves high motion accuracy, high rigidity and high load capacity while reducing frictional resistance.

"The High-Accuracy Series" is available for machine tools such as machining centers and high-precision lathes, as well as for high-precision instruments for manufacturing semi-conductors and liquid crystal displays, among other applications, all of which are required to meet the ever-increasing demand for higher accuracy. These linear guides are therefore well-suited for a broad variety of machinery and equipment that are expected to deliver high-level performance.

1. High motion accuracy

High motion accuracy is achieved in both narrow and wide ranges by adopting ultra-long ball slides and optimum design features for the ball recirculation component.

2. Ball passage vibration reduced to one-third of our conventional models

Tests show ball passage vibration has been reduced to one-third of our conventional models, dramatically improving table straightness.

3. Installation of rail with greater accuracy

Increased counterbore depth of the rail mounting hole reduces rail deflection, which is caused by bolt tightening when fixing the rail to the base component, to 50% or less. This feature restrains the pitching motion of ball slide whose frequency matches to the mounting hole pitch. In addition, the length of mounting hole pitch has been reduced by onehalf of the conventional models, so the rail can be more accurately installed in position.

4. High rigidity and load capacity with lower friction

High rigidity, high load capacity and low friction are achieved by increasing the number of balls.

5. Compact design

Reduced body size enables more compact machinery.

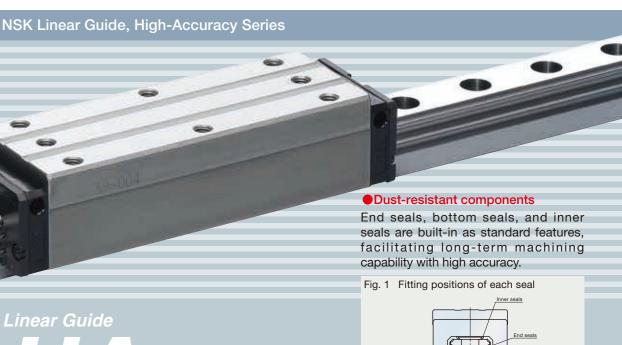

Linear Guide

Linear Guide

Table 1 Examples of High-Accuracy Series applications (based on actual results)

Application	Adverse effects from ball passage vibration	Advantages of High-Accuracy Series
Machining center, grinding machine, dicer, and slicer	Poor finish of worked surface	 Ultra-long ball slides control posture changes which may be caused by ball passage
Coater (linear motion type)	Uneven coated surface of resist	 vibration and rail waviness. Optimum design of ball recirculation components
Plastics processing equipment	Flaw nearly twice as large as ball diameter in pitch occurs in worked surface	 enables the ball to move smoothly and restrain ball passage vibration. Deep counterbore of mounting hole for rail
High-precision table	Deterioration in motion accuracy of table	contributes to reducing possible rail deformation and restricting pitching motion.

High-Accuracy Series: HA/HS Models

HA Model applications

The HA Model linear guides feature improved dust resistance and are ideal for such machines as machining centers, highprecision lathes and grinding machines, for which higher motion accuracy is required.

In addition, they are suitable for discharge machines because of their low friction and high rigidity.

Low friction, compact size

Dust-resistant components

As standard equipment, the ball slides have an end seal on both ends.

Stainless steel models are also available In order to flexibly meet a variety of needs. stainless steel models that are highly resistant to corrosion are also optionally available.

HS Model applications

The HS Model linear quides place special emphasis on lower frictional resistance and compactness and are therefore best suited for dicers, slicers and various manufacturing devices for semi-conductors and liquid crystal displays, for which highgrade accurate surface finish operations are required, including measuring instruments for making highly accurate measurements.

Test results of ball passage vibration

Ball passage vibration can translate into posture changes in the ball slide which result from ball passage (circulation). In the High-Accuracy Series, this vibration has been substantially reduced to one-third of conventional models.

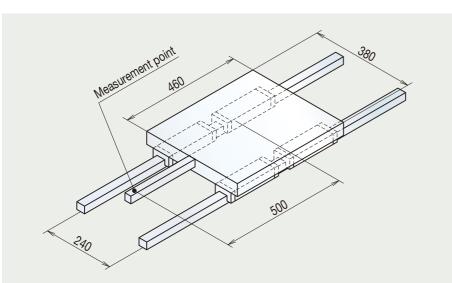

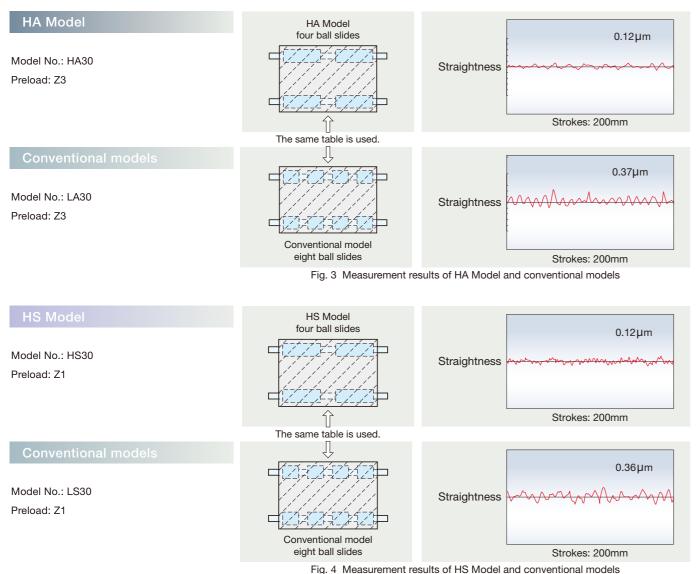

Fig. 2 Schematic view of measurement of ball passage vibration

High rigidity and high load capacity with low friction

Substantially increasing the number of balls in both HA Model and HS Model achieves higher rigidity and load capacity as well as reduced frictional resistance, compared to our conventional models.

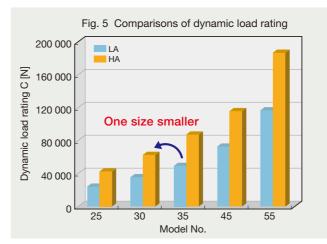

HA Model

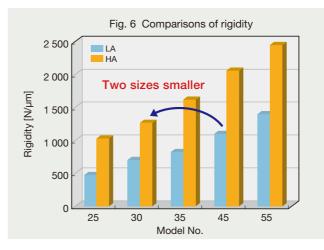

For example, comparing HA Model with our conventional LA35,

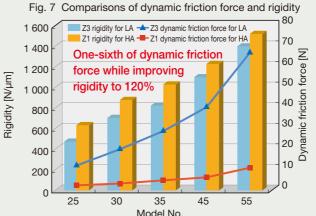

• HA30 : the same dynamic load rating, at one size smaller (Fig. 5)

• HA25 : the same rigidity, at two sizes smaller (Fig. 6)

• HA35 : 120% higher rigidity with one-sixth friction (Fig. 7)

High-Accuracy Series: HA/HS Models

For example, comparing HS Model with our conventional NS30,

- HS25 : the same dynamic load rating, at one size smaller (Fig. 8)
- HS15 : the same rigidity, at three sizes smaller (Fig. 9)
- HS30 : 110% higher rigidity with one-fifth friction (Fig. 10)

NSK 4

Accuracy standard and preload

Three accuracy grades are available: ultra precision P3, super precision P4, and high precision P5. Slight preload Z1 and medium preload Z3 are available for preload. Those can be selected for applications.

Reference number

Reference numbers shall be set to individual when its specifications are finalized, and it is indicated on its specification drawing.

Please specify the reference number, except design serial number, to identify the product when requiring estimates, or inquiring about specifications.

(*1) Stainless steel is only applicable in the HS Model. Surface treatment is provided by low temperature chrome plating (electrolytic rust prevention black treatment). In addition, low temperature chrome plating treatment that further improves anticorrosion properties by means of fluoroplastic coating is also available as an option.

Long-term, maintenance-free operation

The NSK K1 lubrication unit for HA model and the NSK K1-L lubrication unit for HS Model can be installed to ensure long-term, maintaenance-free operation.

Table 5 Dimensions of linear guides equipped with NSK K1 lubrication unit for HA Model

	in labiloadie		modol	Unit: mm
Model No.	Standard ball slide length	Ball slide length with two NSK K1 installed L	Thickness of single NSK K1 V ₁	Protective cover thickness V ₂

Notes: 1) The HS Model does not have a ball retainer. Be aware that balls fall out when the ball slide is withdrawn from the rail. 2) External appearance of stainless steel ball slides differ from those of carbon steel ball slide.

3) The basic load rating comply with the ISO standard. (ISO 14728-1, 14728-2) C₅₀: the basic dynamic load rating for 50 km rated fatigue life C₁₀₀: the basic dynamic load rating for 100 km rated fatigue life The basic static load rating shows static permissible load.
4) Parenthesized dimensions are applicable to stainless steel products.
